

Science in Room 3

This term we have been investigating push and pull forces. Our class looked at forces in water when we pushed a ball.

We investigated which objects would sink or float and thought of the reasons why!

We also were able to make plasticine float by changing the shape!

We predicted where we would find air and were surprised to find it everywhere in our classroom.

We agreed air is everywhere and it takes up space.

Lastly we have investigated what will happen when we change the length of the

blades on a paper helicopter. Most predicted that the helicopters would fall to the ground faster than the helicopter with the longer blades.

We have been predicting, observing and investigating all term about forces.
